# A new land dividend

The opportunity of alternative proteins in Europe

## Country profiles

Here we present the ten European detailed country profiles from Green Alliance's report *The new land dividend* (January 2023).

The report analyses the potential for alternative proteins to substitute meat and dairy production and release land for other purposes, specifically for increasing food self-sufficiency, nature restoration and climate change mitigation.

The countries profiled are: Denmark, Germany, Spain, France, Italy, the Netherlands, Poland, Romania, Sweden and the UK.

We present two scenarios of alternative protein development for each country: 'low intervention', where alternative proteins displace a sixth of meat and dairy demand by 2050, and 'high innovation', where alternative proteins displace two thirds of meat and dairy by 2050.

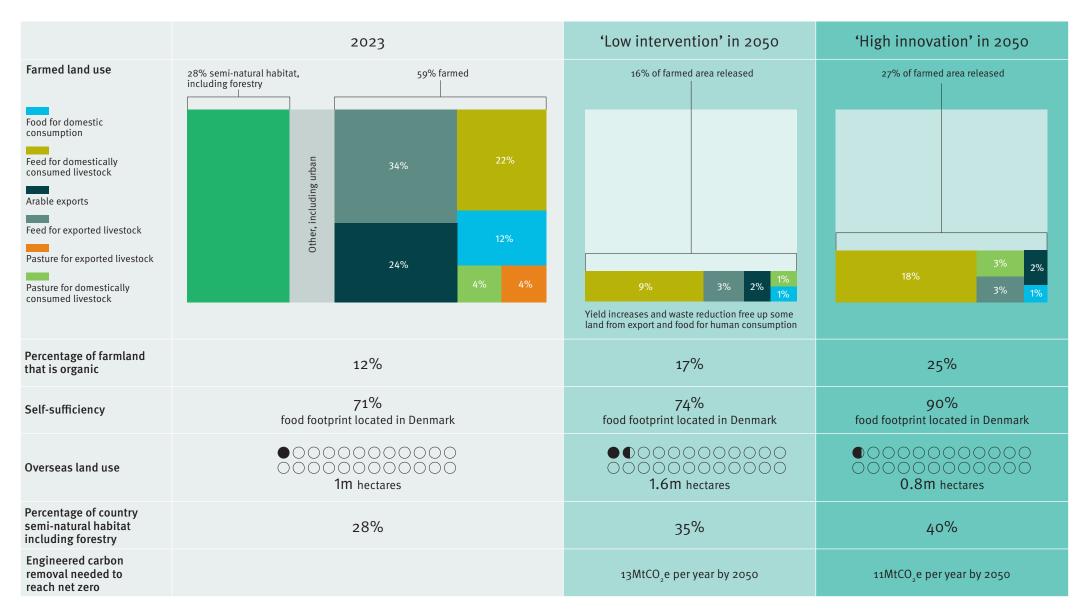

Use of the land freed up in each scenario is equally distributed between onshoring more food production for greater self-sufficiency, expanding semi-natural habitat and expanding agroecological/organic farming, which we refer to as our 'shared dividends' approach.

For each scenario, we quantified the expansion of organic farming and semi-natural habitat, and then estimated what the consequences could be for food self-sufficiency, overseas land use and the potential demand for engineered carbon removals to reach net zero, in terms of emissions across each country's economy by 2050.

### Denmark

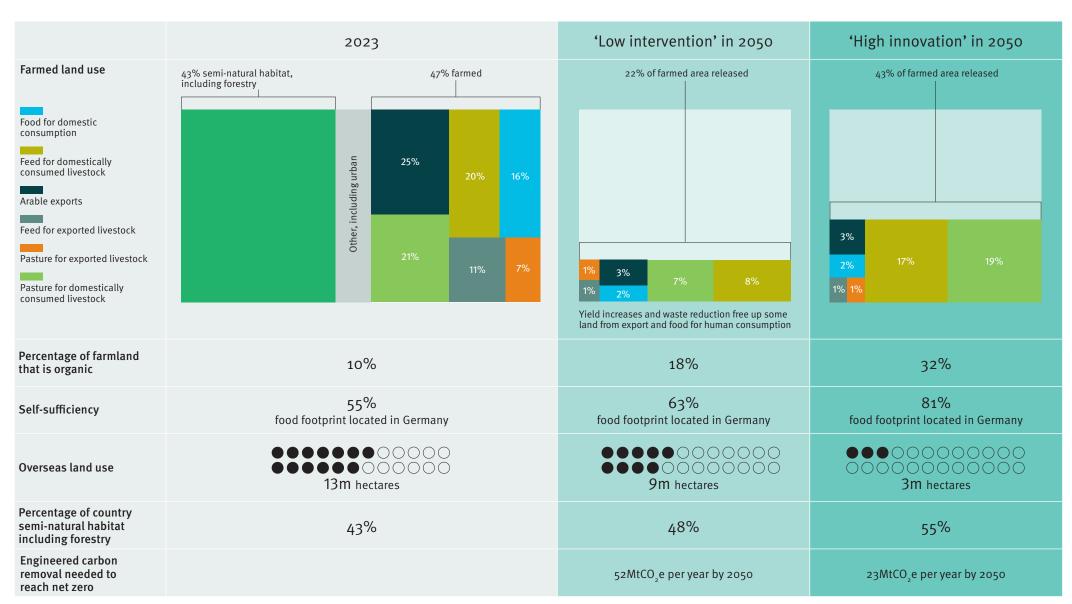

Denmark is a small country that uses most of its farmland to produce exports. Under our 'low intervention' scenario, even by 2050, Denmark could not meet the EU's 2030 target to farm 25 per cent of its land organically without increasing land use overseas. But 'high innovation' could see Denmark meet that target by 2050 whilst becoming more self-sufficient and cutting overseas land use by 20 per cent.

## Germany

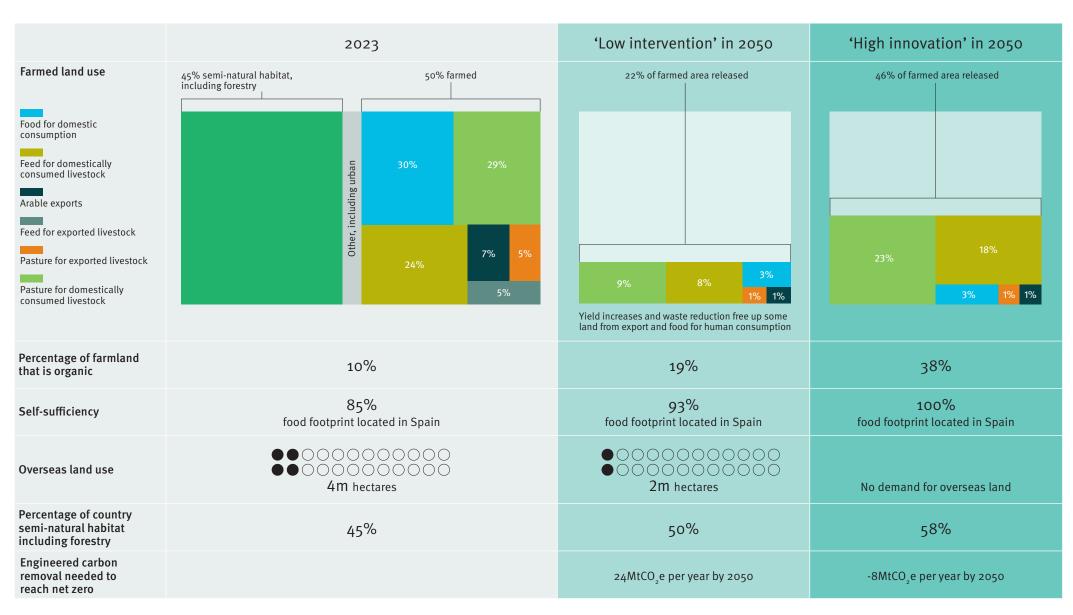

Germany relies on overseas land for nearly half its food supply. Our 'high innovation' scenario would see 81 per cent of Germany's food footprint located within its borders, whilst farming 32 per cent of land organically, cutting overseas land use by three quarters and halving demand for engineered carbon removal to reach net zero by 2050.

## Spain

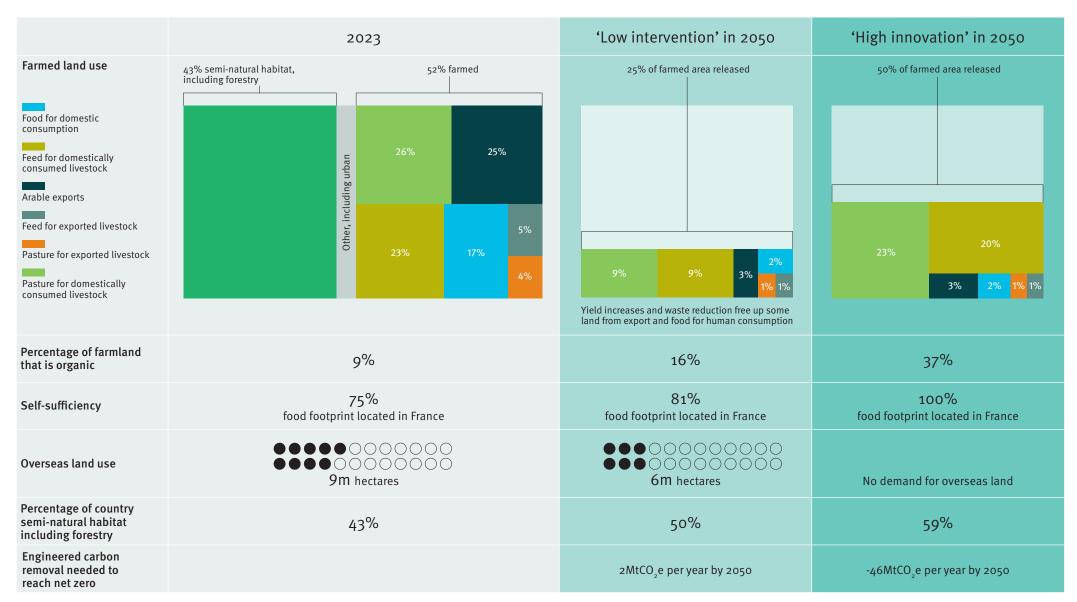

Spain is among the most self-sufficient of the ten countries we studied, but our 'high innovation' scenario would allow it to end reliance on overseas land use, farm 38 per cent of its land organically and reach net negative carbon emissions across its economy by 2050.

#### France

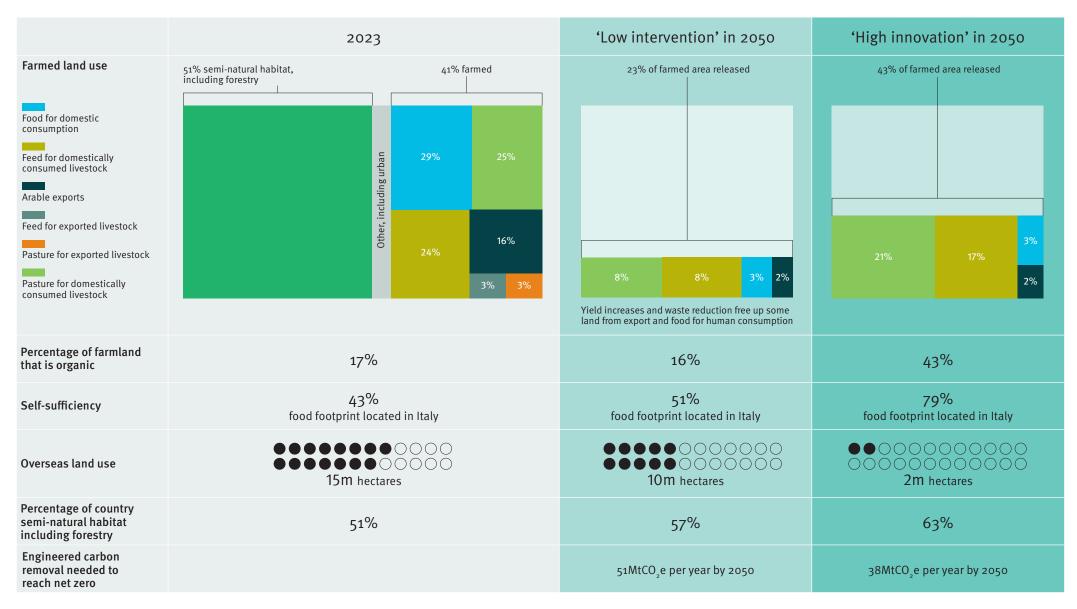

By 2050, our 'high innovation' alternative protein scenario would offer France the opportunity to farm 37 per cent of its land organically whilst eliminating overseas land use, becoming fully self-sufficient and substantially surpassing net zero across its economy by 2050.

# Italy

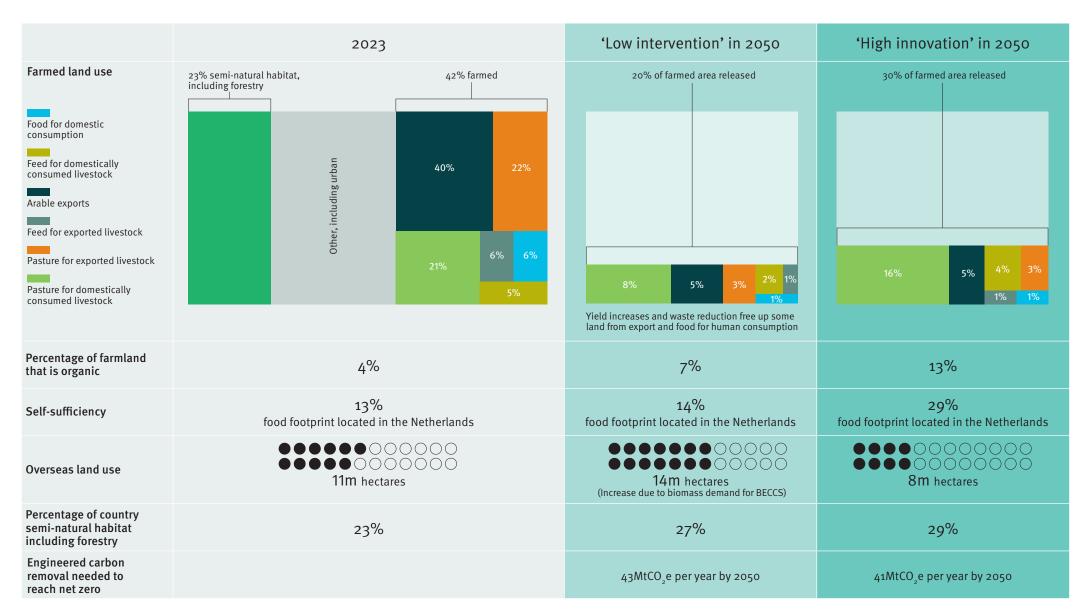

Italy currently relies on overseas land for more than half of its food supply. Our 'high innovation' alternative protein scenario could see Italy nearly double its self-sufficiency in food production whilst farming 43 per cent of land farmed organically and expanding semi-natural habitats to reduce demand for engineered carbon removal by a quarter.

### **Netherlands**

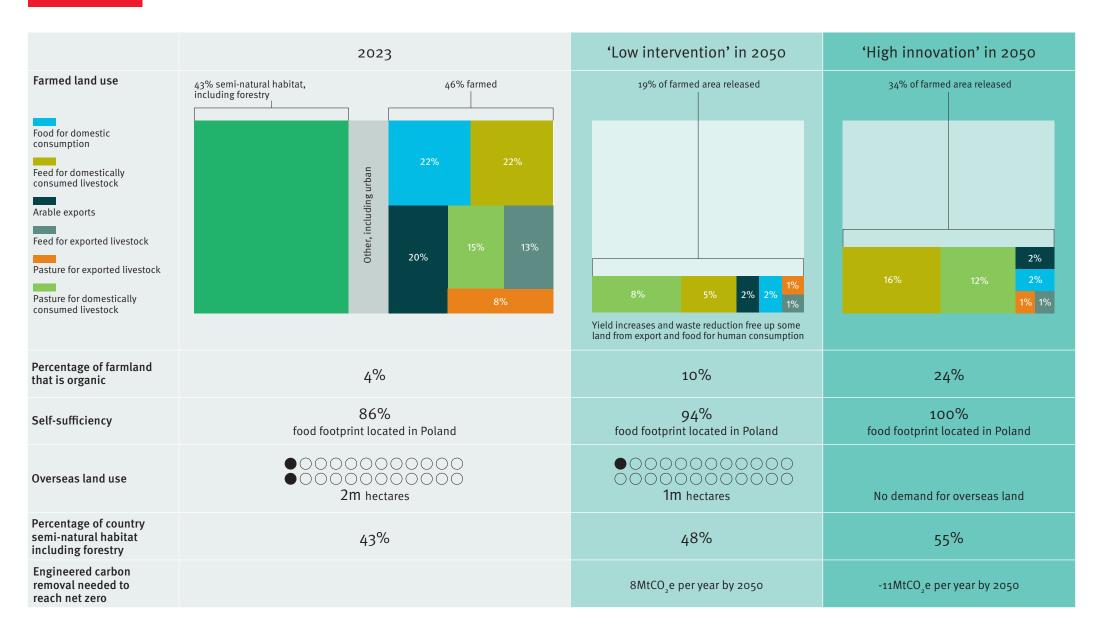

The Netherlands is a small country which uses most of its farmland to produce exports. As a result, the Netherlands relies on overseas land for much of its domestic food supply, and to feed the livestock it exports. Even under our 'high innovation' alternative protein scenario, it could only achieve the EU's target to farm 25 per cent of land organically if it reduced production.

### Poland

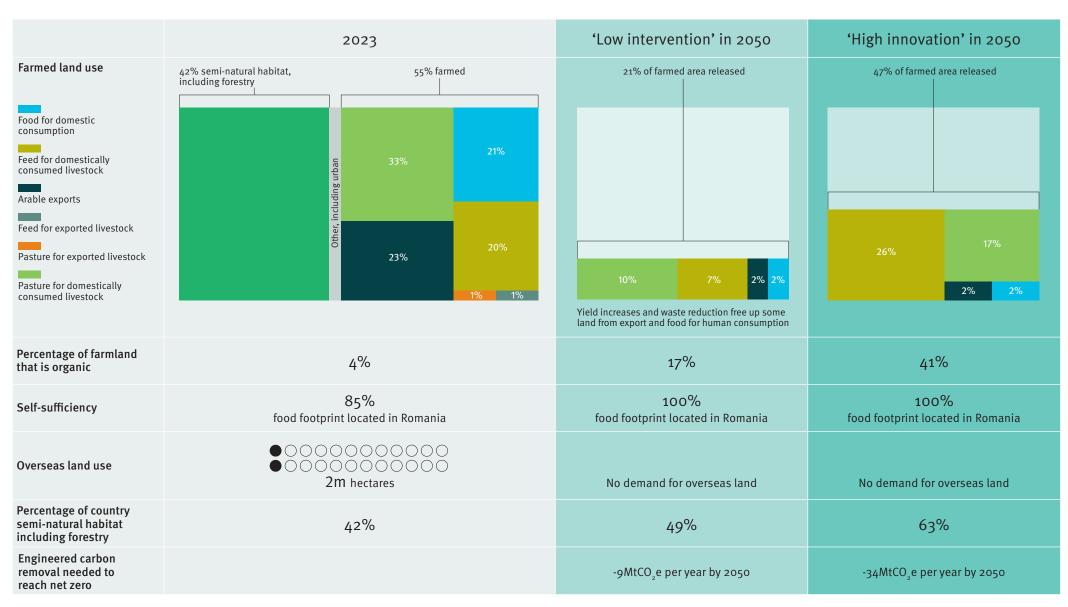

Poland is already among the most self-sufficient of the countries we studied. By 2050, our 'high innovation' alternative protein scenario could see Poland avoid needing any land overseas for food production, whilst farming 24 per cent of its land organically and reaching net zero. Failure to green Poland's power sector could drive substantially greater demand for negative emissions than assumed here.

### Romania

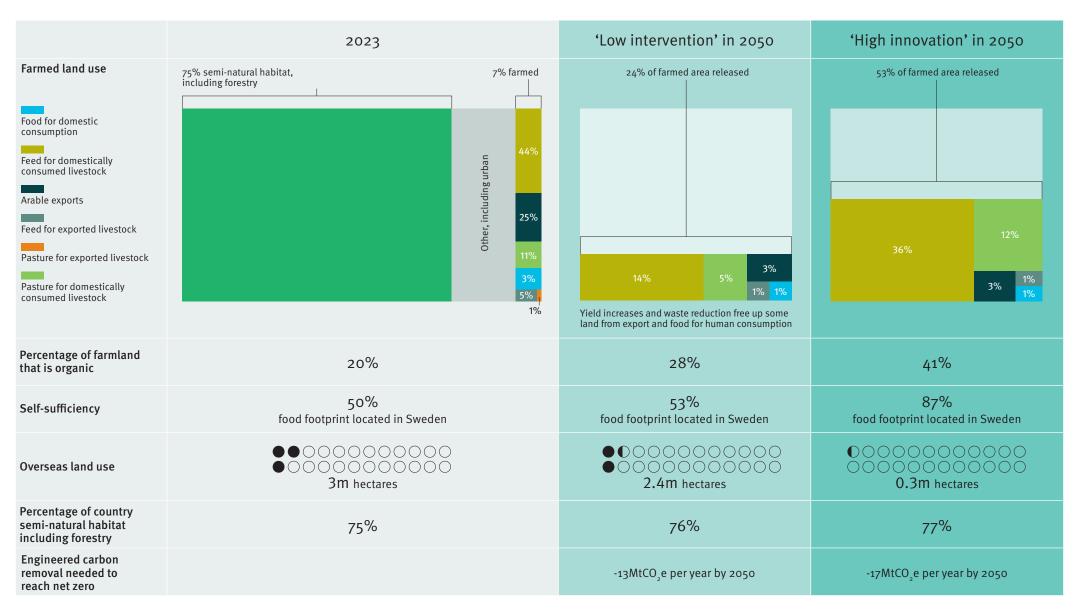

Romania is one of the most self-sufficient of the countries studied, but like Spain and Poland, our 'high innovation' alternative protein scenario offers it the opportunity to onshore all food production, eliminate overseas land use, farm 41 per cent of its land organically and achieve net negative carbon emissions across its economy by 2050.

### Sweden

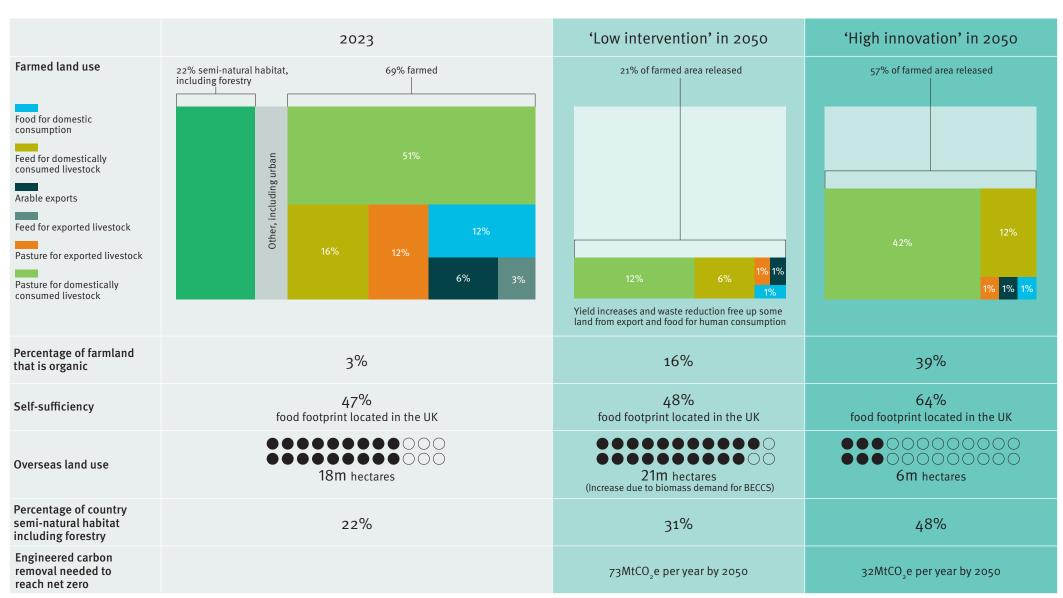

Sweden farms just seven per cent of its land area and relies on land overseas to provide half its food supply. Whilst Sweden will not struggle to reach net zero carbon emissions, given its substantial forest cover, it could bring 87 per cent of its food supply onshore under our 'high innovation' alternative protein scenario.

## **United Kingdom**

The UK is exceptional in how much of its land is used to graze livestock and how little of its land is semi-natural habitat. Our 'high innovation' scenario creates space to more than double coverage of semi-natural habitat, to increase self-sufficiency by a third, reduce overseas land use by two thirds, and farm 39 per cent of its land organically by 2050.
